## EX 028 Maximize with a Cobb Douglas Production Function

Suppose a Cobb-Douglas Production Function is given by following

$$
\mathrm{Y}=\mathrm{L} \mathrm{~K}
$$

where $L$ is units of labor, $K$ is units of capital, $Y$ is total units that can be produced with this labor and capital combination. Suppose to each unit of labor costs $\$ 20$ and each unit of capital costs $\$ 30$, Further suppose a total of $\$ 1500$ in available to be invested in labor and capital. How many units of labor and capital should be purchased to miximize production in budgetary constraint.
